

**unqork**

# Release Notes

Version: 6.82

# Release Highlights

## Introducing the ability to request audit logs!

Audit logs, or audit trails, are records of events and changes in your environment. Examples include logins, logouts, creation and saves, administration changes, and so on. Audit logs capture these events by recording the activity performed, who performed the activity, and how the system responded.

You can now retrieve audit logs to prove compliance with HIPAA and PCI DSS regulations. Unqork now lets you retrieve audit logs at a specific time and date to ensure you protect your business from fines and penalties.

You can now [authenticate and request audit logs](#) for the following events:

- [Configuration Updates](#)
- [Data Access Events](#)
- [User Access and Security](#)

Note: There are more audit logs to come. Visit our [documentation](#) regularly to see additional audit logs.

# Component Enhancements

# Enhancements

- **File component:** Changed the **Post Upload trigger** to only fire when the end-user's selected file is of a type allowed by the **Set File Formats to Accept** setting.
- **Multi-Select Dropdown component:** Added support for the **Clear** button (visible when the **Show Clear Button** setting is set to  (ON)) to respond to `readOnlyView` and `disabled` Output Types from logic components.
  - If `readOnlyView` is **yes**: The **Clear** button is hidden from the end-user.
  - If `disabled` is **yes**: The **Clear** button is disabled to the end-user.

The screenshot shows a unqork multi-select dropdown component. The component is a light blue rounded rectangle with the unqork logo in the top left. Below the logo is a white input field with a small downward arrow on the right side. To the right of the input field is a small yellow button with the text "Clear" and a thin border.

# Platform Architecture Enhancements

# Enhancements

- **Excel Files:** Upgraded the library responsible for parsing incoming Excel files and generating Excel exports in Unqork. This enhancement increases stability, security, and improves parsing of date-like values.

Affected areas of the Platform include the:

- Chart component's **Download as XLS/XLSX** settings.
- Content component's **Include Excel Download Link** setting.
- Data Workflow component's **Excel to JSON** operator.
- Get Configuration **Analysis Results API** (when the format query parameter is `xlsx`).
- Creator (User) Administration's **Export All Creators** functionality.
- Excel Fill Template Administration, including the **Upload Excel Template API**.
- Express User Administration's **Export All Express Users** functionality.

# Bug Fixes

# Bug Fixes

## Administration

- **Service Users:** Fixed an issue where Service users could log into their environment and see the Platform UI even with **Client Credentials** enabled.

## APIs

- **APIs:** Fixed an issue where empty request header rows were not being removed correctly from service calls. Service calls no longer include empty values.
- **Execute via Proxy APIs:** Increased the file upload limit to 100 MB for files sent to a server-side executed using a proxy request.

# Bug Fixes (Cont'd)

## Components

- **Dynamic Grid component:** Fixed an issue where filtering on **Text**, **Single-Select Dropdown**, or **Multi-Select Dropdown** columns were case sensitive. This resulted in values like `Hello` and `hello` appearing twice in the filter option list. Now, filtering on these columns is not case sensitive and consolidates filter options of this kind.

**NOTE:** This change results in a known third-party library limitation where the `Blanks` filter option is non-functional. Please contact your Customer Success representative for more information.

- **File component:** Fixed an issue where `.AVI` & `.AVCHD` file types didn't validate properly when used in the **Set File Formats to Accept** setting.
- **Formulas:** Addressed a security vulnerability involving malicious use of the **REFERENCE** component in logic components.
- **Multi-Select Dropdown component:** Fixed an issue where the component incorrectly showed a red, required asterisk (\*) next to the component label when the following settings were set to  (ON):
  - **Required**
  - **Allow Multiple Selections**
  - **Read Only View**

# Bug Fixes (Cont'd)

## Components

- **Multi-Select Dropdown component:** Fixed an issue with the font styling and spacing applied in Express View was incorrect when the **Read Only View** settings were set to  (ON).
- **Number component:** Fixed an issue where a value that included only a decimal character (".") was automatically trimmed from the component after a few seconds, or when unfocusing the component. Now, a value of only a **decimal** (".") displays and shows an **Invalid Number** validation error.
- **Feature Flag** **Number component:** Fixed an issue where the thousands separator didn't render when **Show Thousands Separator** was set to  (ON) and the browser's language was set to "Spanish - español" (also known as locale = "es").
- **Feature Flag** **Number component:** Fixed an issue where an **Invalid Number** validation displayed unexpectedly when the decimal separator was a **comma** (,) as a result of the end user's locale. This issue is limited to languages that use commas as a decimal separator. For example, German and Italian.
- **Radio Buttons component:** Fixed an issue where the component's **Trigger** failed to fire if the Radio Buttons component had a Property ID with a **hyphen** (-) in it.

# Bug Fixes (Cont'd)

## Components

- **ViewGrid component:** Fixed an issue where the **Select Row Output** submission data retained old selections after updating the ViewGrid component data using the **value** Output Type from logic components.

## Workflow Builder

- **Task node:** Fixed an issue where an intermittent **Module Not Found** error message would display after selecting a module in environments with large volumes of modules.
