

unqork

Release Notes

Version: 6.86

API Enhancements

Enhancements

APIs

- **Audit Logs:** Added support for new audit log endpoints. The following endpoints have been added:
 - delete-style-default
 - modify-style-details
 - promote-style-details
 - set-style-default
 - delete-pdf-template
 - download-pdf-template
 - upload-pdf-template
 - copy-module-admin
 - restore-module-admin
 - add-application-librarymodule
 - export-application
 - move-application
 - search-application-librarymodule
 - delete-application
 - promote-application
 - add-workspace-user
 - delete-workspace-user
 - preview-application
 - modify-share-settings
 - createfolder-managed-assets
 - delete-managed-assets
 - download-managed-assets
 - upload-managed-assets
 - start-workflow-node
 - stop-workflow-node

Component Enhancements

Enhancements

Components

- **Data Workflow component:** Added the ability to add an **Error Trigger** to a Data Workflow component. This setting lets you configure a component to make display an error in the DevTools Console when the Data Workflow fails.

The screenshot shows a configuration window titled "Data Workflow" with a close button in the top right. Below the title bar are two tabs: "Data Workflow Options" (active) and "Permissions". Under "Data Workflow Options", there is a "Trigger Type" dropdown menu currently set to "Manual". To the right of the dropdown are two checkboxes: "Disable Execution" and "Debug". Below these is an "Error Trigger" field with a placeholder text "Enter a Property ID". At the bottom, there is a "Field Tags" section with an "Add a tag" button.

- **Data Workflow component:** The component now gives more descriptive error messages when you enable the **Debug** setting.
- **Multi-Select Dropdown component:** Added a new **Auto-Select Highlighted Option When Clicking Outside** setting to control when options are automatically selected when the end-user clicks away from the drop-down.

Application, Module Builder, and Platform Architecture Enhancements

Enhancements

Applications

- **Applications:** When logging out of an application and back in, the query string is now preserved so any parameters being passed to the application with URL are retained, like styles.

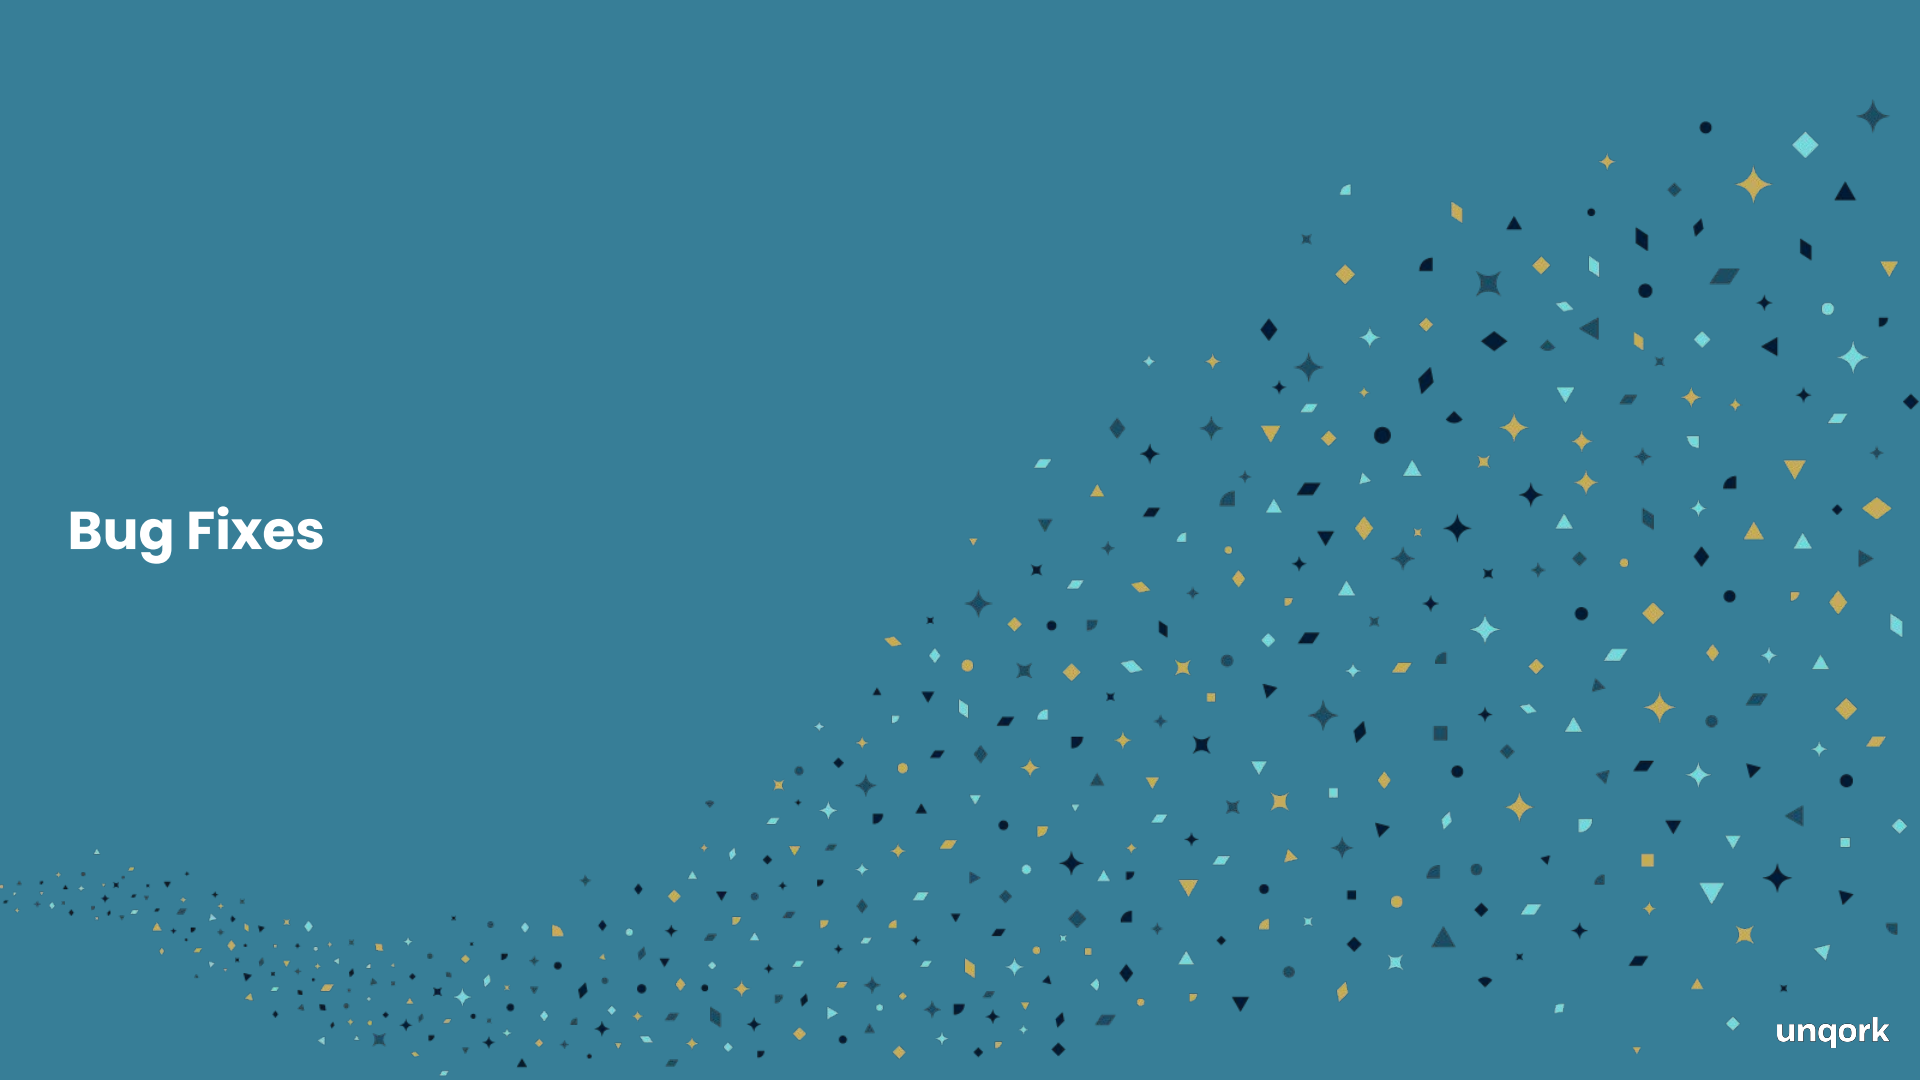

Module Builder

- **Modules:** When copying a module dependent other modules, Data Collections, or workflows, elements you do not have permission to view are removed.

Platform Architecture

- **Data Management Systems (DBMS):** Added asynchronous processing to the back-end index operations for improved stability. There should be no impact to Unqork applications.

Bug Fixes

Bug Fixes

Applications

- **Data Collections:** Fixed an issue where Data Collections were slow to render in Designer.

Components

- **Data Workflow component:** Fixed an issue where saving a Data Workflow operator without required inputs caused the operator's **Info** window to remove settings when reopened. For example, defining a Clean Keys operator without selecting an option from the **Fill If** drop-down menu.
- **Data Workflow component:** Fixed an issue where searching for Data Workflow operators didn't work when a component with the name of **filterInput** existed in the module.
- **Email, Dropdown, Radio Buttons components:** Fixed an issue where the labels for the Email, Dropdown and Radio Buttons components would display incorrectly in Designer when set to **Read-Only** view.
- **File component:** Fixed an issue where .AAC & .FLAC file types did not validate properly when applied to the **Set File Formats to Accept** setting.

Bug Fixes (Cont'd)

Components

- **Freeform Grid component:** Fixed an issue where editing values in a dynamically-refreshed Freeform Grid component caused column header labels to disappear.
- **Multi-Select Dropdown component:** Fixed an issue where, in certain situations, the URL value of the **Data Source Type** setting was not displaying.
- **Number component:** Fixed an issue where, in certain situations, validations were not displaying in Express View when using a decimal separator other than a **period** (.). For example, using a **comma** (,) as a decimal separator.
- **Number component:** Fixed an issue where the end-user's input was automatically trimmed if there was only a **negative sign** (-) present.
- **ViewGrid component:** Fixed an issue where pagination controls didn't display when the **Source Has Pagination** setting was enabled.
