

unqork

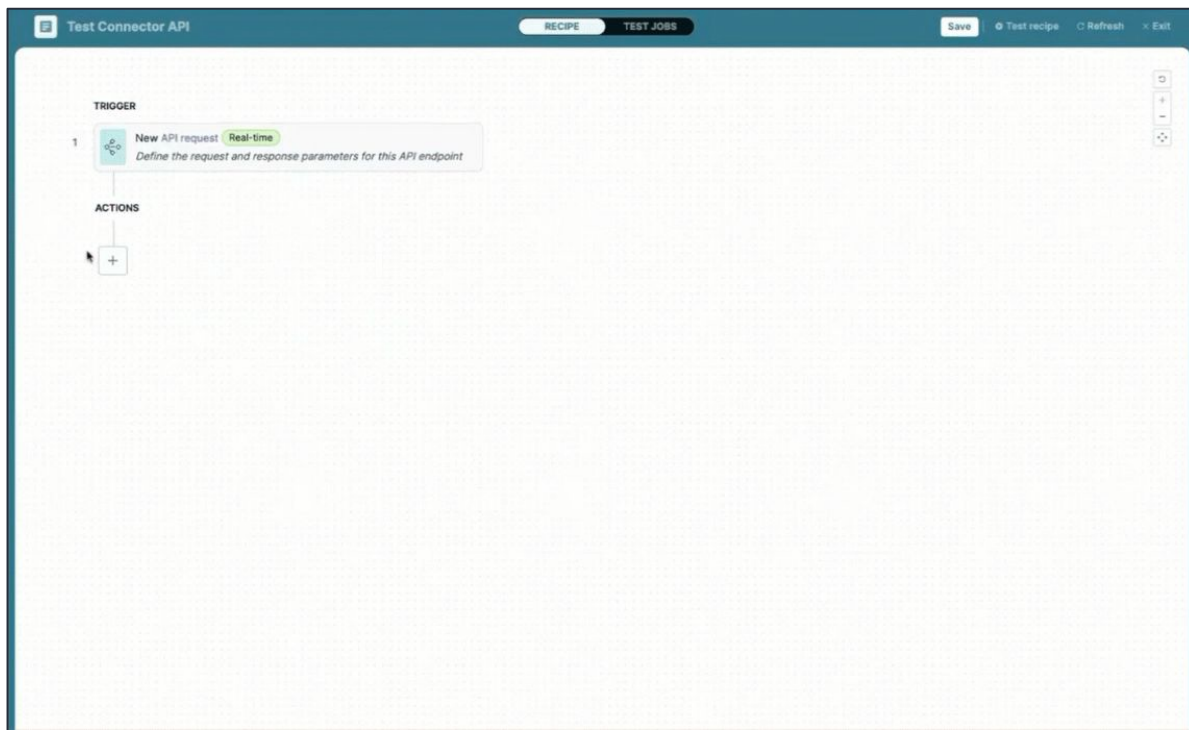

Platform Release Notes

Version: 7.6.0

Release Highlights

Improved Integration Gateway Functionality

To make it easier when setting up your desired connections using Unqork's Integration Gateway, we have introduced a standard Unqork connection. This connection will be shared to all customer environments and can be used to enable a more efficient connection to Unqork's internal APIs when configuring recipes.

Introducing Unqork's Data Experience

- **Data Models GA:**
 - Data models now support Dynamic Refresh and imported modules.
 - Data Models now support deeply-nested structures. For example, objects that contain arrays, objects, other arrays, other objects, and so on.
 - Improved flow for managing changes to your Data Models. Easily change your data structures as your application evolves.
- **Data Model Queries Projections:**
 - Creators can now select which data properties they want returned when accessing records using an API. This functionality reduces dependency on complex data workflows and improves query performance.
- **Data Model Relation Queries:**
 - Creators can now perform relational queries that retrieve information from multiple Data Models using a single API call, improving performance. This functionality lets Creators make queries that leverage `$lookup` and `$unionWith` options.
- **Data Models Schema Versioning:**
 - Beginning with this release, every time a Creator updates a Data Model structure, a copy of the original structure is kept and a new Data Model version is created. Doing so lets Creators understand all changes made to the Data Model and improve Bulk Transform operations for Data Models based on their structure changes.

Enhancements

Enhancements

Administration

- **Client Tracker Administration:** Improved handling of PII (personal identifiable information) by preventing Protected Field component values from being tracked. Added guidance to determine whether to use a Protected Field component if sensitive data is involved.
- **Environment Administration:** This enhancement increases the password length from 8 to 12 characters. This update affects new users only. If a user has a password with 8 characters, they will not be asked to change it to 12 characters once this enhancement is released. But, if they do a reset their password, then they are required to have 12 characters.
- **Integration Gateway:** You can now enable the streaming of job history and collaborator history from your Integration Gateway activity to a log provider of your choice. Choose which events you would like to stream from the job history summary, job history details, and user activity audit logs to monitor that occurred in the Integration Gateway. These logs can be streamed to Amazon S3, Azure Monitor, Azure Blob, or a cloud-based logging service of your choice.

If you are an Unqork Integration Gateway customer, and would like this functionality enabled, please submit a support ticket here: <https://support.unqork.com/>.

Bug Fixes

Bug Fixes

Administration

- **Client Tracker Administration:** Fixed an issue where the `context` key populated incorrectly if the Panel component configuration was copied or previously had a module import.

Components

- **Date Input component:** Fixed an issue when existing date values changed unexpectedly after deleting a digit from the day, month, or year, and clicking outside of the input box.
- **File component:** Added a new setting that lets Creators customize the error message that displays when a file is uploaded with an incorrect format.
- **Number component:** Fixed an issue when editing values in the Number component when **Show Thousands Separator** is set to  (ON).

Module Builder

- **Dynamic Refresh:** Fixed an issue where, in certain situations, if the Panel component's post-trigger is executed in quick succession, the post-trigger would execute indefinitely.
