Release Highlights

Introducing the Unqork GenAI Connector

Together with its versatile GenAI connector, the Unqork Enterprise App Cloud enables the rapid creation of secure, enterprise-ready AI-enabled applications without the weight of technical debt or code.

This new feature enables the following key concepts:

- **Intuitive:** Simplify the integration of GenAI into your applications using an intuitive connector to accelerate modernizations.
- **Faster time to value:** Rapidly and iteratively create AI-enabled applications with Unqork's drag-and-drop visual Designer platform.
- **Secure:** AI-enabled applications equipped with enterprise-grade security and compliance.
- **Fuel Innovation:** Unqork takes on the burden of maintaining your applications throughout their lifecycle, so you can focus on innovation.

This release contains early access features. To get access to these features, please contact your Customer Success Representative. The first version of this connector only supports connections with Google AI (Gemini) and OpenAI (gpt 3.5 turbo) models.

Enhancements

Enhancements

Administration

- **Services Administration:** This feature lets Creators connect an external Azure Blob Storage bucket to Unqork using a standard service authenticator. Using Services Administration page, Creators can create and select Azure Blob Storage from the list of standard authenticators. A new field displays where Creators can enter their connection string obtained from Azure Blob Storage to establish the connection between Unqork and the external storage.

This enhancement is specific to Unqork's new Bulk Data Operations (BDO) feature. It only affects those users that are part of the early-access program.

APIs

- **Azure Blob Storage:** This enhancement adds support for the Azure Blob Storage standard service authenticator to the `fileDownload` endpoint. Doing so lets users download files between Unqork and their external Azure Blob Storage bucket. Users can enter their Azure Blob Storage service name, desired bucket, Unqork cloud storage cloud key, and Azure bucket target directory to send a file from Unqork to their external Azure Blob Storage bucket.

This enhancement is specific to Unqork's new Bulk Data Operations (BDO) feature. It only affects those users that are part of the early-access program.

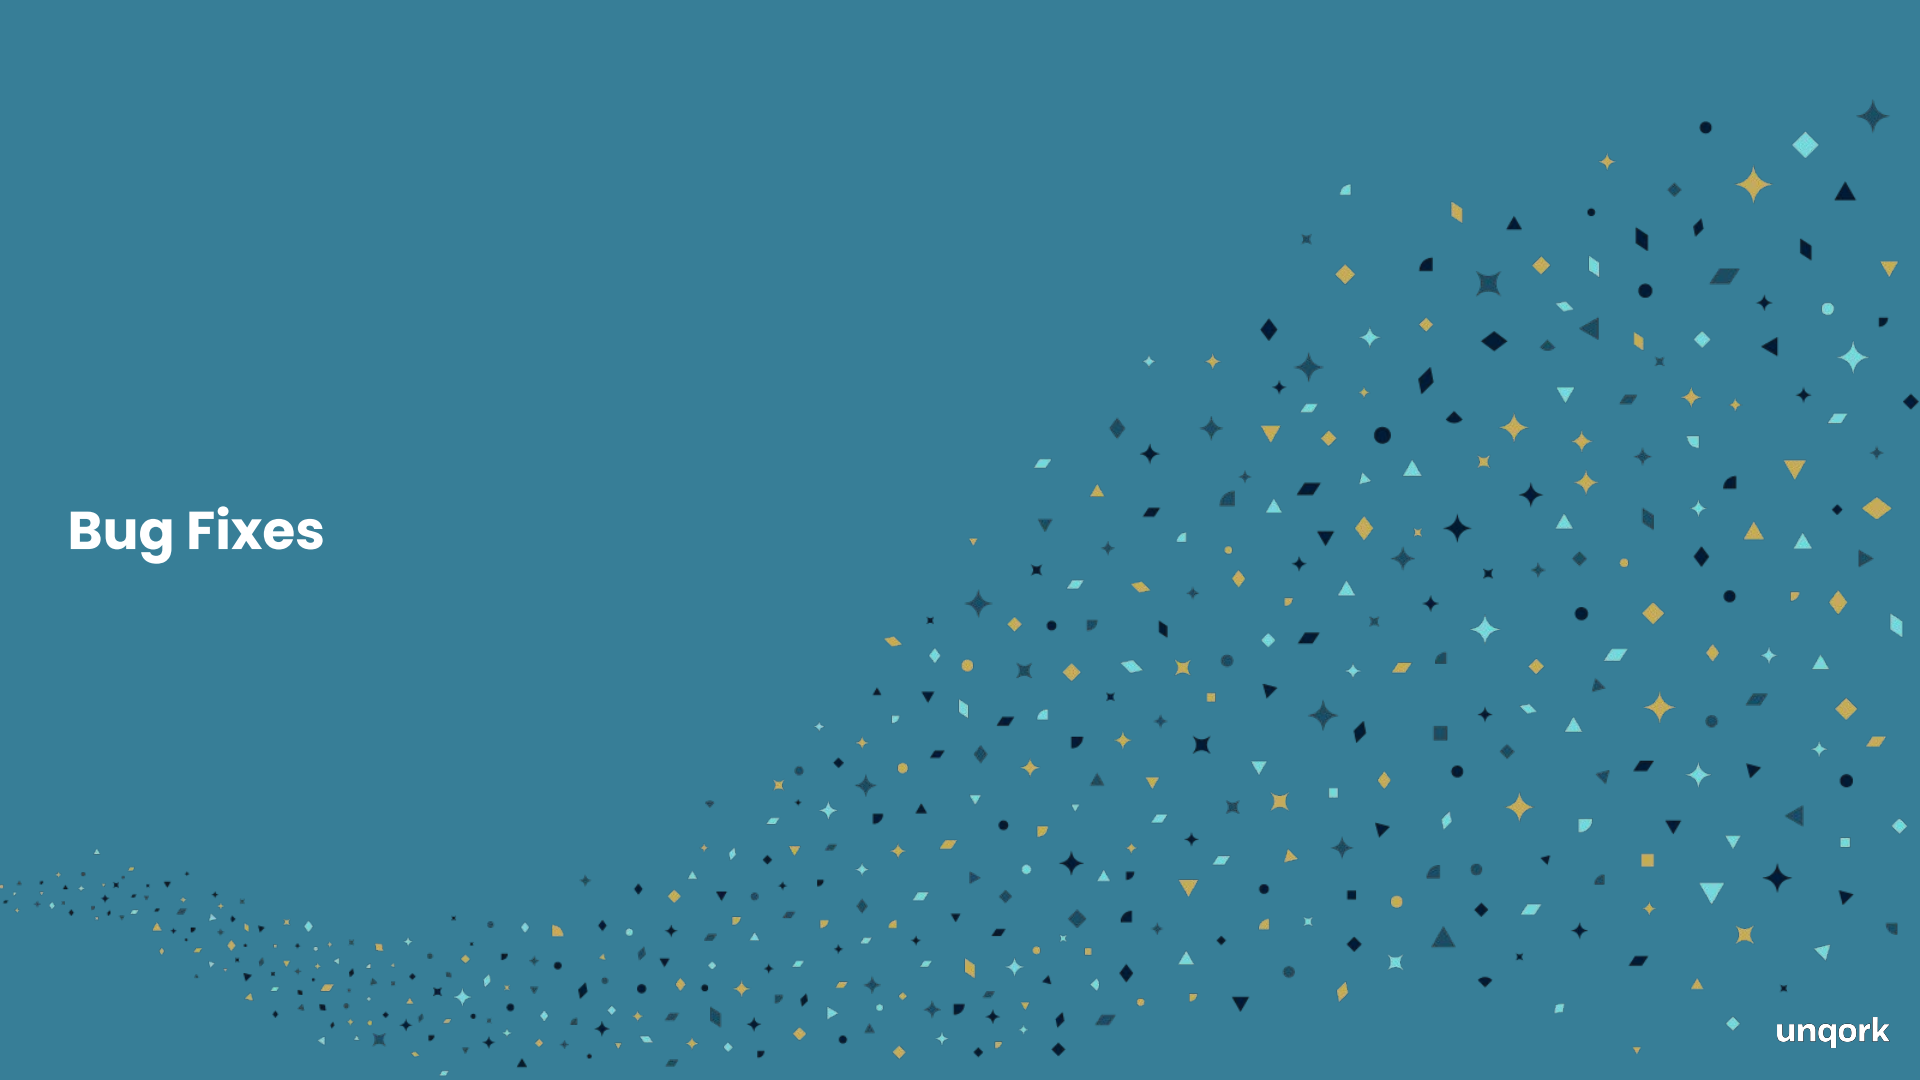

Enhancements (Continued)

Workspaces

- **Data Modeling:** Added a new resolver that lets Creators remove a specific Data Model record revision when a record is updated over time, generating a revision. This new endpoint lets Creators delete those revisions (changes over time) for that record.
- **Visual Query Builder:** Added the ability for Creators to sort records returned from the `getModelRecords` API endpoint.

Bug Fixes

Bug Fixes

Components

- **Panel component:** Fixed an issue where the component's post-trigger fired indefinitely, causing the panel to dynamically refresh without stopping.
